

HOT MASK

HEAT TREATMENT

After being properly heated, the Alps Hot Mask stimulates microcirculation in the skin; increasing the absorption rate of the lipophilic antioxidants into the skin and decreasing the viscosity of the sebum.

It has been widely demonstrated that when the skin temperature rises, the absorption of topical agents also increases as well as work to open the pores. Therefore, during or after the Hot Mask application, be sure to apply your favorite oil-based topical agent(s) to allow for deeper penetration of the active ingredients.
